

CHSI Stratification Process

JULY 2000

Providing information for improving community health

www.communityhealth.hrsa.gov

PEER COUNTIES

A distinctive aspect of the CHSI Project is that each county can be compared with its peers, those counties similar in population composition and selected demographics. Comparison of a county to its peers is thought to take into account some of the factors that make a difference in a community's health.

Strata, or peer groups, were developed with input from an advisory committee composed of Federal, State, and local public health professionals and members of academia. The project goal was to develop strata of 20-50 counties each, providing several peers for each county. The relatively large number in each stratum allows counties to choose a few peers that they believe to be most like them. The stratum size averages 35 and ranges from 14 to 58 counties. There are a total of 88 strata.

To define the strata, the following five factors were used:

- (1) Frontier status (The National Committee on Rural Health recommended classifying areas as frontier if they had fewer than 7 persons per square mile. Source: Popper, F.J. (1986) The strange case of the contemporary American frontier. *Yale Review*: 76(1); 101-121);
- (2) Population size, using the National Association of County and City Health Officials' population categories (less than 25,000; 25,000-49,999; 50,000-99,999; 100,000-249,999; 250,000-499,999; 500,000-999,999; 1,000,000 or more);
- (3) Poverty quartiles (less than or equal to 10.55%; 10.56-14.15%; 14.16-19.25%; more than 19.26%), based on the percentage of individuals in the county living below the poverty level (e.g., in 1995 and for a family of four, the poverty level is \$15,569);
- (4) Median age categories, based on the percentage of children (percentage of persons age<18 less than 26.13% or greater than or equal to 26.13%) and elderly (percentage of persons age 65+ less than or equal to 14.70% or greater than 14.70%) in the county; and
- (5) Population density, as measured by half deciles (e.g., CHSI stratum 45 ranges between 42-157 persons per square mile).

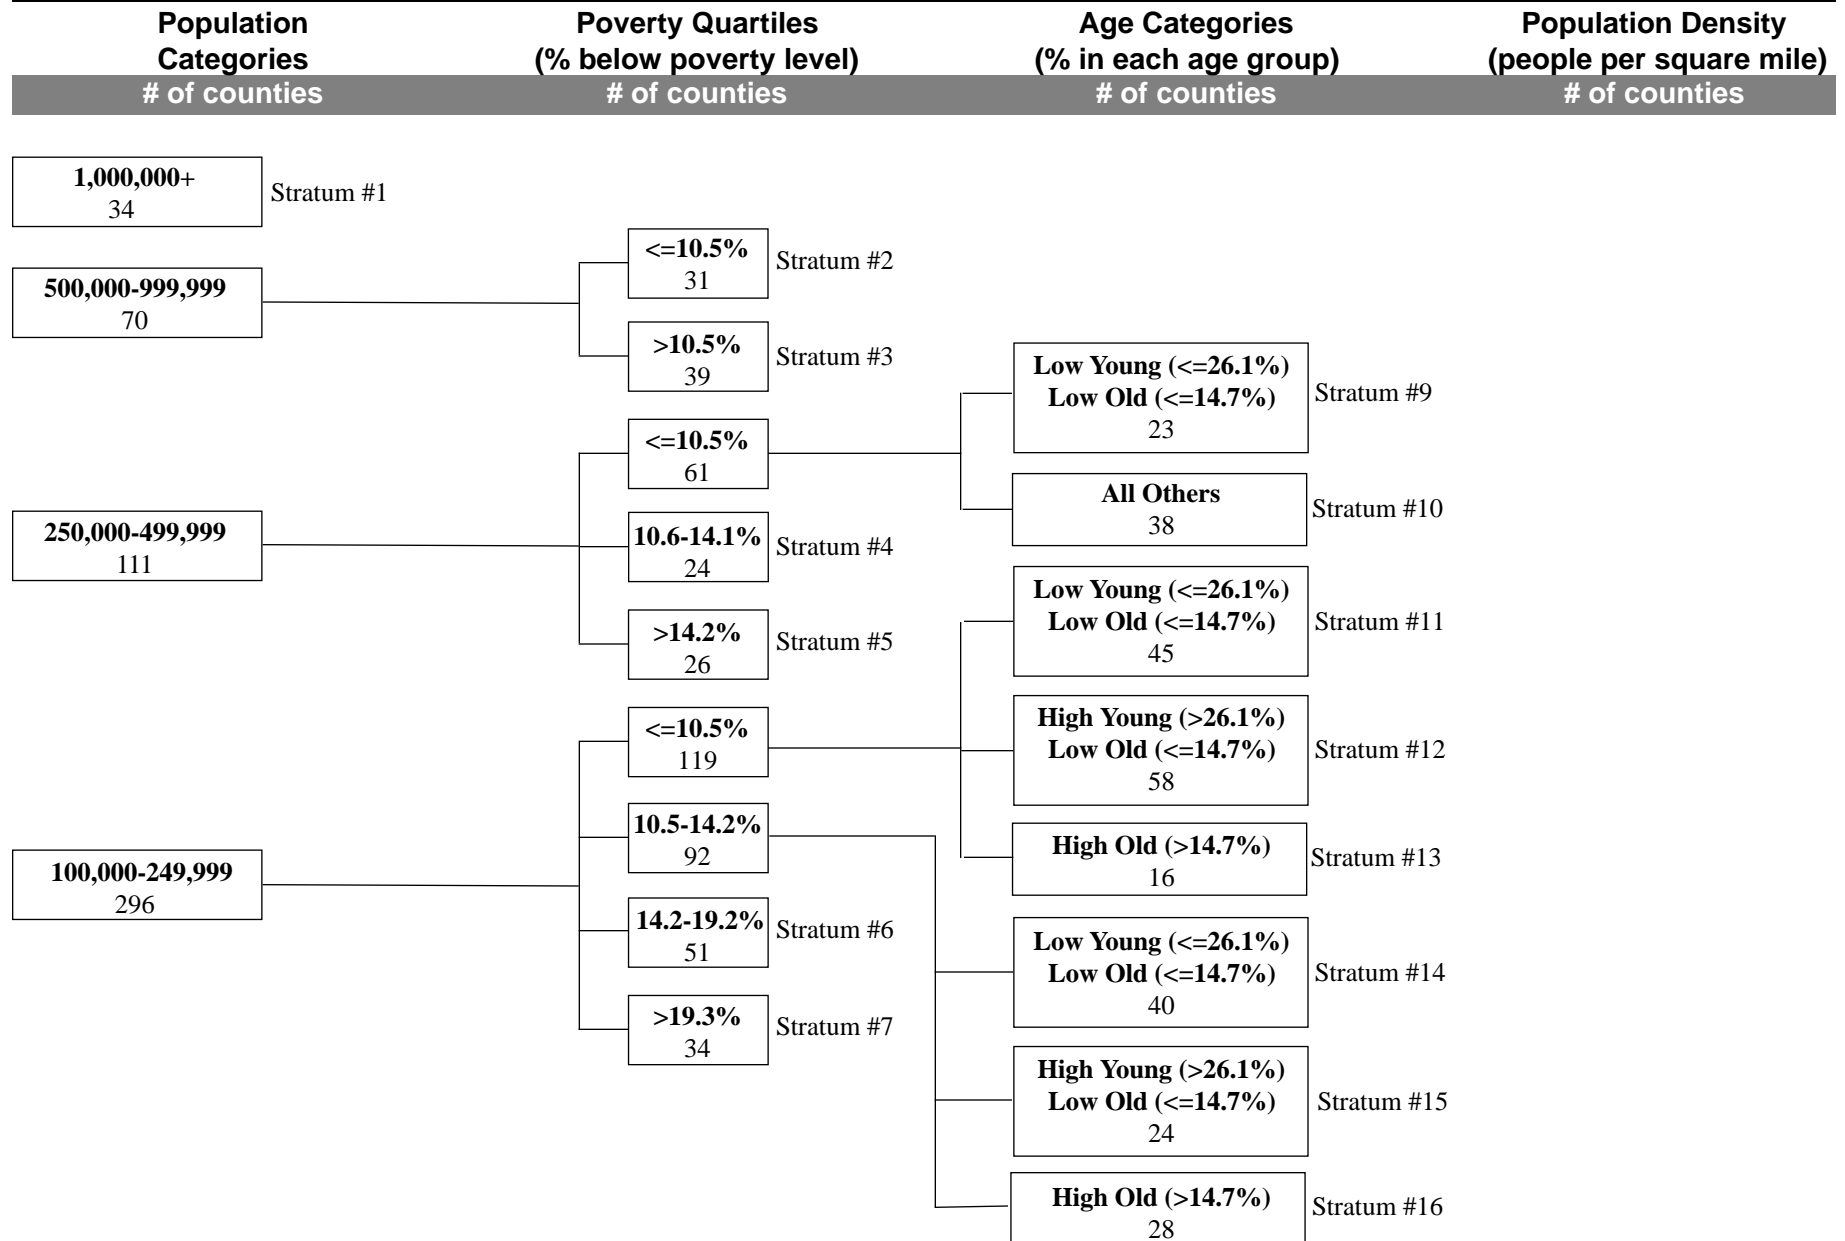

Using an ordered, staged approach, counties were first grouped according to frontier status. Population size was used next. Then, as the number of counties in each category allowed, further groupings were made based on the remaining variables until the optimum stratum size was reached. Therefore, while all peer groups were classified according to the first two variables, only some were defined by factors of poverty, age, and population density. A schematic of the stratification process follows.

Each of the 88 strata is uniquely defined by two or more of the factors. It is possible that counties that are similar in several factors may not be in the same stratum due to category divisions.

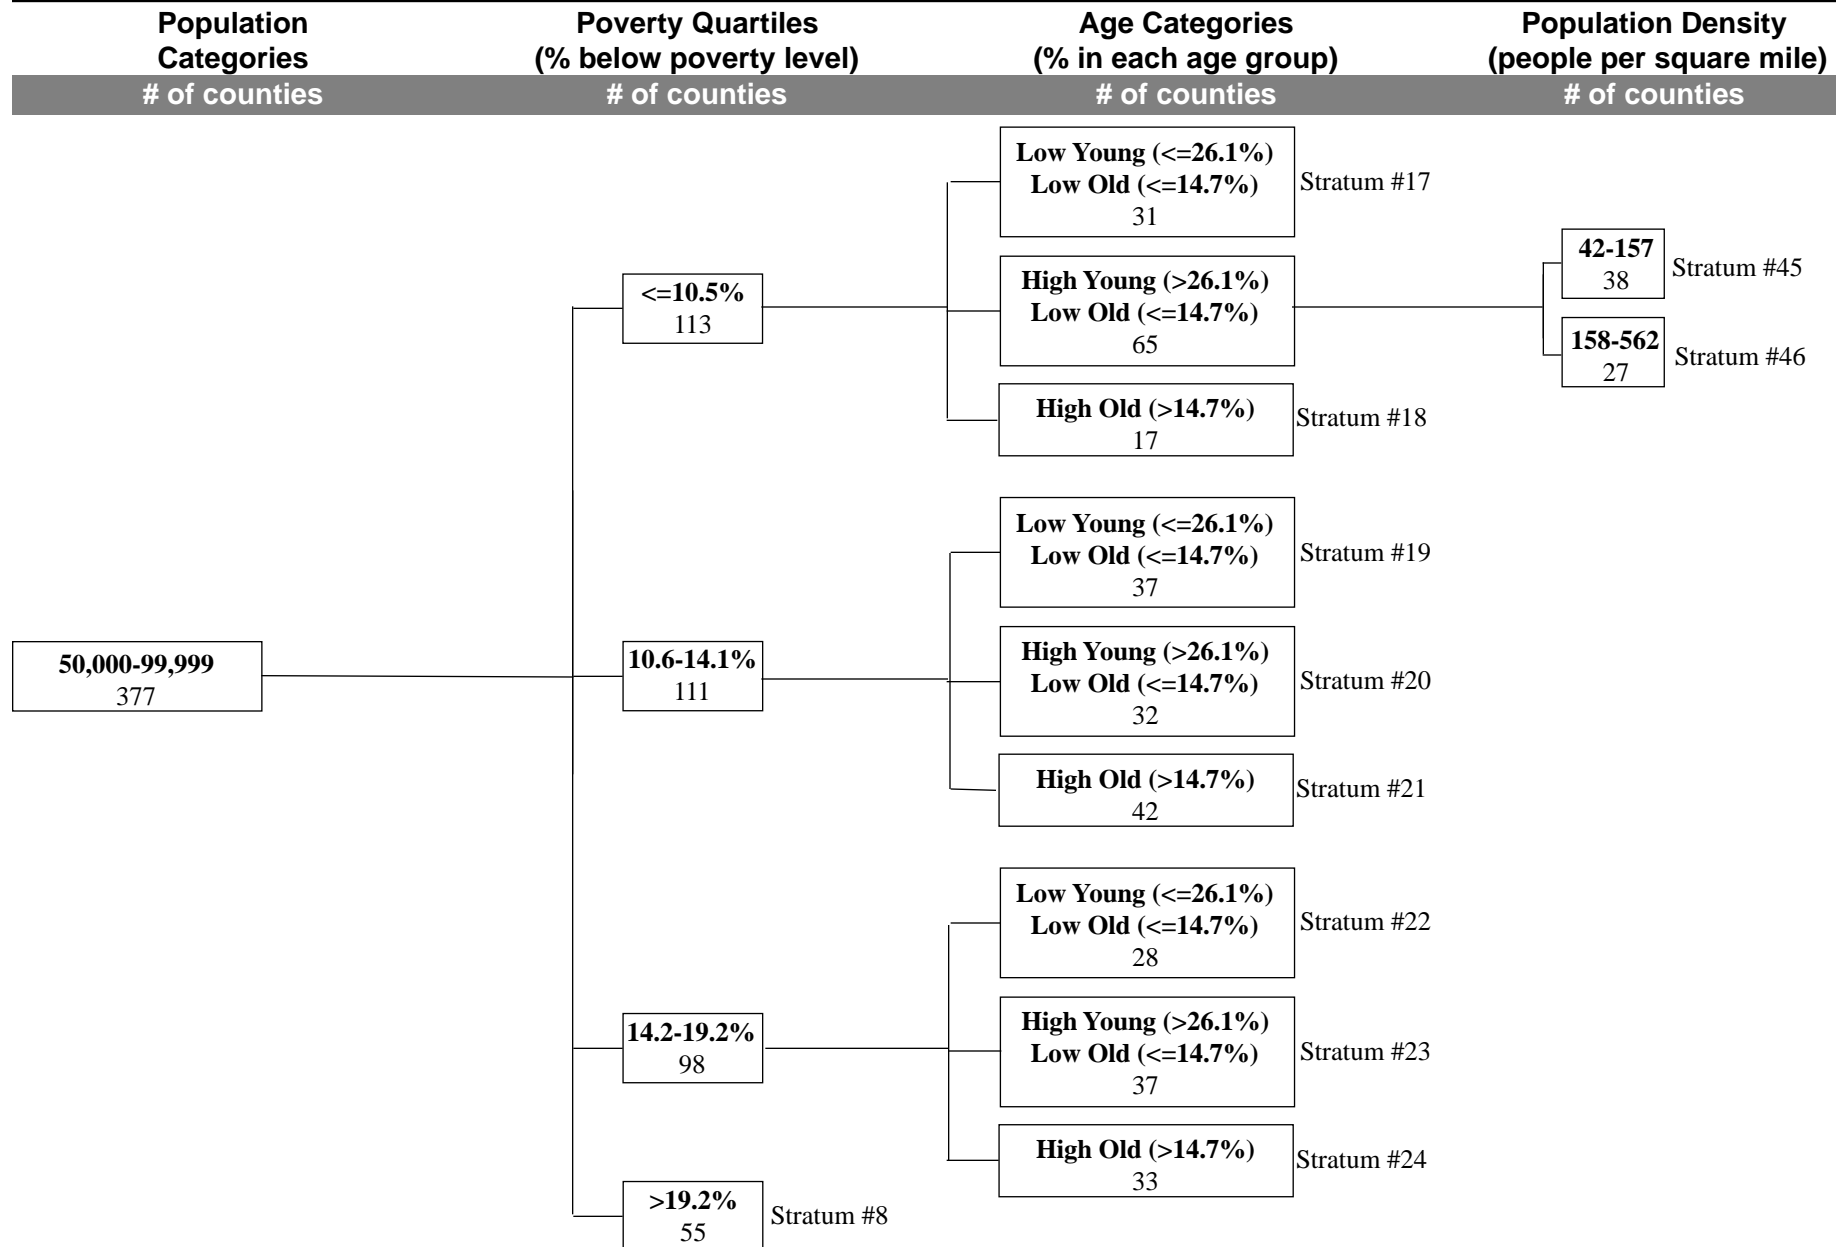

The Strata Listing contains stratum by number and provides the number of counties and the ranges for population size, density, and poverty level for each. This table provides the characteristics of all strata and allows identification of other strata having similar characteristics. We encourage you to view this table to examine additional strata generated using this method and to explore other counties' reports.

This is the project's initial attempt at forming peer groupings of counties. Please feel free to comment at the Web site listed above to any of the CHSI partners on this process and its utility. Future reports may use different methods and/or criteria for determining strata.

CHSI Stratification Algorithm for Non-Frontier Counties (≥ 7 people per square mile) $n=2677$

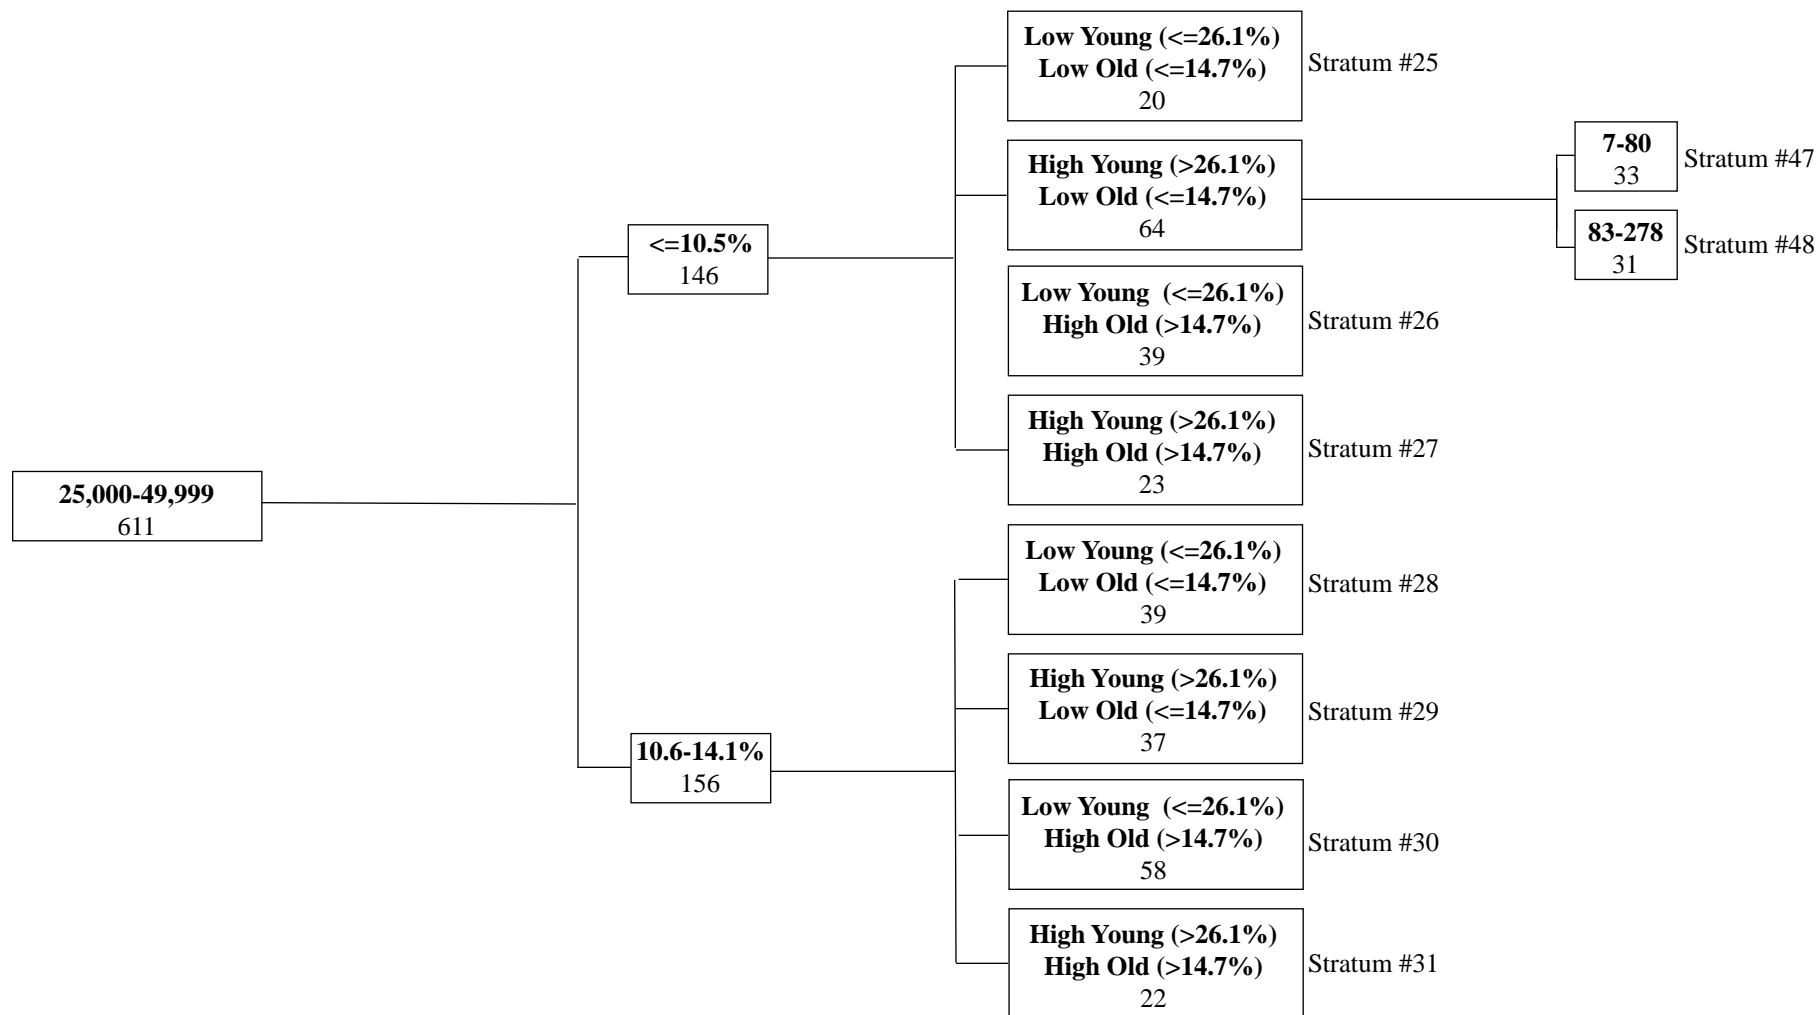

CHSI Stratification Algorithm for Non-Frontier Counties (≥ 7 people per square mile) $n=2677$
